Department of Endocrinology

Comprehensive Follow-up Consultation

Patient Name:	John Doe	Medical Record #:	MRN-2026-001247
Age / Sex:	55 years / Male	Date of Visit:	2027-03-02
Consultant:	Dr. Sarah Smith, MD (Endocrinology)		

REASON FOR FOLLOW-UP

Follow-up evaluation following initiation of basal insulin therapy for worsening glycemic control in Type 2 Diabetes Mellitus.

INTERVAL HISTORY

Mr. John Doe returns for routine follow-up approximately four months after starting Insulin Glargine. The patient reports excellent adherence to both insulin and oral medications. He states that the education session with the diabetes educator significantly improved his understanding of carbohydrate intake, meal planning, and home glucose monitoring.

Following the conclusion of the tax season, he resumed his previous exercise routine, walking 40–45 minutes at least five days each week. He has also begun preparing meals at home and reports substantially reducing processed foods and sugary beverages. Home glucose records over the past eight weeks demonstrate fasting blood glucose values consistently between 95–115 mg/dL. He denies episodes of symptomatic hypoglycemia, dizziness, blurred vision, excessive thirst, polyuria, chest pain, or shortness of breath. Overall, he reports feeling more energetic and sleeping better.

CURRENT MEDICATIONS

Medication	Dose	Status
Metformin	500 mg orally twice daily	Continue
Amlodipine	5 mg orally once daily	Continue
Insulin Glargine	8 units at bedtime	Reduce Dose (from 10 units)

PHYSICAL EXAMINATION & VITALS

Parameter	Current Visit	Previous Visit
Blood Pressure	126/80 mmHg	136/84 mmHg
Heart Rate	72 bpm	80 bpm
Respiratory Rate	16 / min	16 / min
Temperature	98.1 °F	98.4 °F
Weight	84 kg (-6 kg)	90 kg
Height	173 cm	173 cm

Parameter	Current Visit	Previous Visit
BMI	28.1 kg/m²	30.1 kg/m²

LABORATORY RESULTS

Test Description	Current Result	Previous Result
HbA1c	6.9%	8.9%
Fasting Plasma Glucose	104 mg/dL	178 mg/dL
Random Blood Glucose	138 mg/dL	246 mg/dL
Serum Creatinine	0.9 mg/dL	0.9 mg/dL
eGFR	>90 mL/min/1.73m²	>90 mL/min/1.73m²
Total Cholesterol	178 mg/dL	196 mg/dL
LDL Cholesterol	108 mg/dL	126 mg/dL

ASSESSMENT

- Type 2 Diabetes Mellitus:** Demonstrates excellent improvement following the initiation of basal insulin therapy combined with renewed lifestyle modification. HbA1c decreased significantly from 8.9% to 6.9%, successfully meeting the individualized treatment goal.
- Essential Hypertension:** Confirmed excellent control on existing therapeutic Amlodipine regimen (126/80 mmHg).
- Lipid Profile:** Hypercholesterolemia has improved (LDL down to 108 mg/dL), showing compliance with secondary health adjustments.
- Weight Status:** Achieved a sustained weight reduction of 6 kg since the previous visit, lowering BMI back to 28.1.
- Renal Profile:** Renal function remains stable and entirely normal.

TREATMENT PLAN

- Oral Therapy:** Continue Metformin 500 mg orally twice daily and Amlodipine 5 mg orally once daily.
- Injectable Adjustments:** Reduce Insulin Glargine to 8 units subcutaneously at bedtime due to sustained glycemic improvement.
- Lifestyle Maintenance:** Continue current diabetic diet modifications and maintain a regular exercise regimen (minimum 150 minutes/week).
- Monitoring:** Maintain consistent home glucose monitoring.
- Preventative Screenings:** Annual diabetic eye examination recommended. Arrange annual diabetic screening investigations before the next review.
- Follow-up Evaluation:** Schedule repeat HbA1c monitoring in 3 months.

PATIENT EDUCATION

The patient was congratulated on his commitment to lifestyle modification and medication adherence. The importance of maintaining these changes for long-term cardiovascular and metabolic health was reinforced. The patient demonstrated good understanding of insulin dose adjustment, blood glucose monitoring, and recognition of hypoglycemia symptoms.

FOLLOW-UP

Return in 3 months for routine diabetes and hypertension review. Annual diabetic screening investigations to be arranged before the next comprehensive review.
